

UIDesignPatterns

User interface designs are patterns that can be used in order to solve a problem that affects the performance of the program in use.

To encourage the user to register would be a method such as the design “Lazy Registration” which is to offer the user a method that can test what the program offers that would be to see the parks that are in vote for remodeling for example that users can see a list of parks with an interactive design that the user can scroll in a carousel reading the names of the parks and the districts corresponding to those to persuade the user to select a park to select a button that says “Register” that leads to registration to make such a vote.
